PRACTICAL INFO

Date: 19/10/2026 (10:00 - 12:30)

Location: Marie-Elisabeth Belpaire building (03.N.08) and via Microsoft Teams

Facilitator: Valy Van den Broeck (valy.vandenbroeck@vlaanderen.be)

Github Repository: https://github.com/belgif/thematic/tree/master/person

ATTENDEES

Name	Organisation
Valy Van den Broeck	Digitaal Vlaanderen (facilitator)
Dylan Van Assche	Digitaal Vlaanderen (editor)
Lieven Verreycken	Digitaal Vlaanderen
Suzanne Put	Digitaal Vlaanderen
Jary Caeldries	Digitaal Vlaanderen
Filip Borloo	Karret
Alix Badot	SMALS
Benoit Fricheteau	Paradigm Brussels
Bart Vrancken	National Register (IBZ)
Amandine Pirnay	National Register (IBZ)
Vincent Turine	KSZ - BCSS
Jonas De Meulenaere	KSZ - BCSS
Miguel Discart	KBO - BCE
Liesbeth d'Hondt	BOSA

AGENDA

Time	Item
10:00 - 10:05	Planning
10:05 - 10:20	Review TW1: Historic Tracking
10:20 - 10:35	Review TW1: Concepts & Attributes
10:35 - 11:00	Use Case 1: Change of main household residence
11:00 - 11:15	Break
11:15 - 11:35	Use Case 2: Temporary absence & foreign address
11:35 - 11:55	Use Case 3: Dual domiciliation & reference address
11:55 - 12:15	Q&A and next steps

INTRODUCTION

GOAL OF THE SESSION

The second thematic workshop of the ICEG Person trajectory had three objectives: (1) to review the changes made to the draft model following the first thematic workshop (Core Person Identification), (2) to present the use cases and the draft model for Residence and Address, and (3) to collect feedback from the participants on the new version of the draft model. The input captured during the session is consolidated in this report and will be processed in the next iteration of the model.

As in the first workshop, the approach is iterative and consensus-based, following the U−1 decision rule. Quick polls in the room are done with +1 (agree), −1 (disagree) and 0 (no opinion). The workshop reports are made publicly available on GitHub.

SCOPE OF THEMATIC WORKSHOP 2

The scope of this second thematic workshop covered the core concepts of **Place of Residence** and **Domiciliation**. This includes:

- Main residence
- Temporary absence
- Foreign addresses
- Reference address
- Legal domicile

GENERAL REMARKS

Remark: All feedback should be collected via GitHub and not via e-mail. E-mail is an unstructured way of communicating and not convenient for people who want to raise issues on the modelling of a specific attribute or class.

➢ ***Answer:*** *Agreed. GitHub issues are the preferred channel for feedback because they are easier to track. Participants who are not able or do not wish to use GitHub can send their feedback by e-mail to the facilitator, who will create the corresponding GitHub issue on their behalf. Participants can "watch" the repository to receive e-mail notifications of new issues and updates.*

Remark: All Belgif thematic issues are currently grouped in one single GitHub repository, which is impractical to track issues related to ICEG-Person specifically. Other initiatives (e.g. OSLO) moved from one large repository to separate repositories per domain for exactly that reason.

➢ ***Answer:*** *The core team will check with BOSA whether the thematic repository can be split per domain.*

REVIEW OF THEMATIC WORKSHOP 1

The first part of the session reviewed how the feedback of the first thematic workshop (Core Person Identification) was processed in the draft model.

HISTORIC TRACKING

Following the feedback of the first workshop, the following principle was introduced: a person exists once, and each characteristic that can change over time is held in its own class with a validity period (startDate, endDate). The person's current values are derived from those records.

- **Period:** a record is valid from startDate until endDate.
- An empty endDate means the record is still valid.
- **Order:** startDate must be before endDate.
- **No overlap** for single-valued characteristics.
- **Nothing is overwritten.** History is cumulative (0..* cardinality).

This principle applies to all classes for which historical tracking is relevant: name, nationality, title, registered sex and alternative name. The attributes are also kept in the Person class itself to remain compatible with the SEMIC Core Person Vocabulary and allow the current situation to be expressed. As all elements are optional, an implementer can choose to use only the current situation on Person, or the full history through the separate classes.

Questions and remarks:

Question: When an error is made and must be corrected, would it not be better to have a deletion date ?

- ***Answer:*** *With the current principle, a correction results in a new record, while the previous record receives an end date. This, however, does not allow distinguishing a correction from a real-life change, and the corrected value should in principle apply from the original start. The discussion highlighted the difference between a business date (the date from which a value is legally valid) and a technical date (the date on which the change was encoded or corrected in the system). However, assuming all technical dates are out of scope is too restrictive.* A name corrected in the past may already have been used on official documents. It must remain possible to retrace that between date A and date B the person was known under a given name, and that this name was later corrected.
- ***Answer:*** *No separate deletion date will be introduced. Instead, a* ***reason / type of change*** *(code list) will be added as an attribute to the historized classes. The code list should include types such as correction, change of name, new name. This makes it possible to distinguish technical corrections from business changes without a deletion date. Consequently, overlap of records must be allowed as the erroneous and the corrected record can cover the same period.*
- ***Action****: The participants are asked to send specific use cases for corrections (i.e. eID issued with an erroneous name, retroactive corrections) so that the values of the enumeration can be defined.*

Remark: If the full history is used, the current value must also be present in the history classes (with an empty end date), because otherwise its start date is not known. This implies that the relationship between the current situation on Person and the history should be 1 instead of 0.

- ***Answer:*** *Two usage scenarios are supported: (1) the consumer only needs the person at this moment in time and uses the attributes on Person, or (2) the consumer needs dates and history and uses the history classes, in which case the current value is also included as a record without end date. The cardinality 0..* is therefore kept in the semantic model; stricter rules can be imposed at implementation level.*

CONCEPTS & ATTRIBUTES

The following changes to concepts and attributes, made after the first workshop, were presented:

- **Identifiers:** a person can have many identifiers (identifier [0..*]). Each identifier names its issuer (creator: Agent [0..1]). The label "registration" is renamed to "identifier", in line with SEMIC.
- **Registered sex and gender:** registered sex is a time-bound record with a start and an end date. Gender is not modelled; only the salutation used to address a person is captured (honorificPrefix) under contact details (ContactPoint).
- **Nationality:** added as a time-bound record with a start and an end date. A person can hold several nationalities over time, or at once. The value comes from the STATBEL nationality code list.

Questions and remarks:

Remark: The alternative name is more than a name: a person may be known under a certain name in combination with a specific nationality and date/place of birth (e.g. a name translated or adapted in another country, a German married name next to the birth name). A concern was raised that this could lead very far (romanisation, transliteration from non-Latin alphabets, naming conventions of other countries), while the trajectory is anchored in the Belgian (legal) context. Other participants stressed that foreigners with a link to Belgium may keep their own naming rules by law, and that the model should be as little restrictive as possible.

- ***Answer:*** *The class* ***Alternative name*** *is kept as presented, and a* ***type*** *attribute will be added. The links to nationality and birth will be optional (0..1). No history of birth information will be kept inside the alternative name.*

Remark: Some countries do not use family names, while the National Register today has to fill in a value for these persons.

- ***Answer:*** *Agreed by all participants, the cardinality of familyName becomes 0..* .*

Remark: Honorific prefixes are also used for titles such as doctor, professor or engineer. It should be clear whether honorificPrefix is used only for the form of address linked to gender or in the broader sense.

- ***Answer:*** *To avoid confusion with titles, honorificPrefix is renamed to pronouns. This captures how a person wants to be addressed, independently of the registered sex. Titles such as doctor or professor are captured under Title.*

Remark: Titles such as doctor or professor are not nobility titles. Furthermore, a distinction exists between Belgian and foreign titles: a foreign nobility title cannot normally be used publicly in Belgium, but it is useful to know it.

- ***Answer:*** *NobilityTitle is renamed to Title, and nationality is added as an attribute of Title*

Remark: The authentic source for the nationality code list is **FPS Foreign Affairs**, not STATBEL. Attention must be paid to the validity periods of the codes, which sometimes differ between the lists.

- ***Answer:*** *The STATBEL code list is replaced by the code list of the FPS Foreign Affairs.*

Remark: For official communication, the language to be used for the address should be captured. The language of the address depends on the competent authority (federal, Communities, Regions) and the person's preferred choice (if applicable).

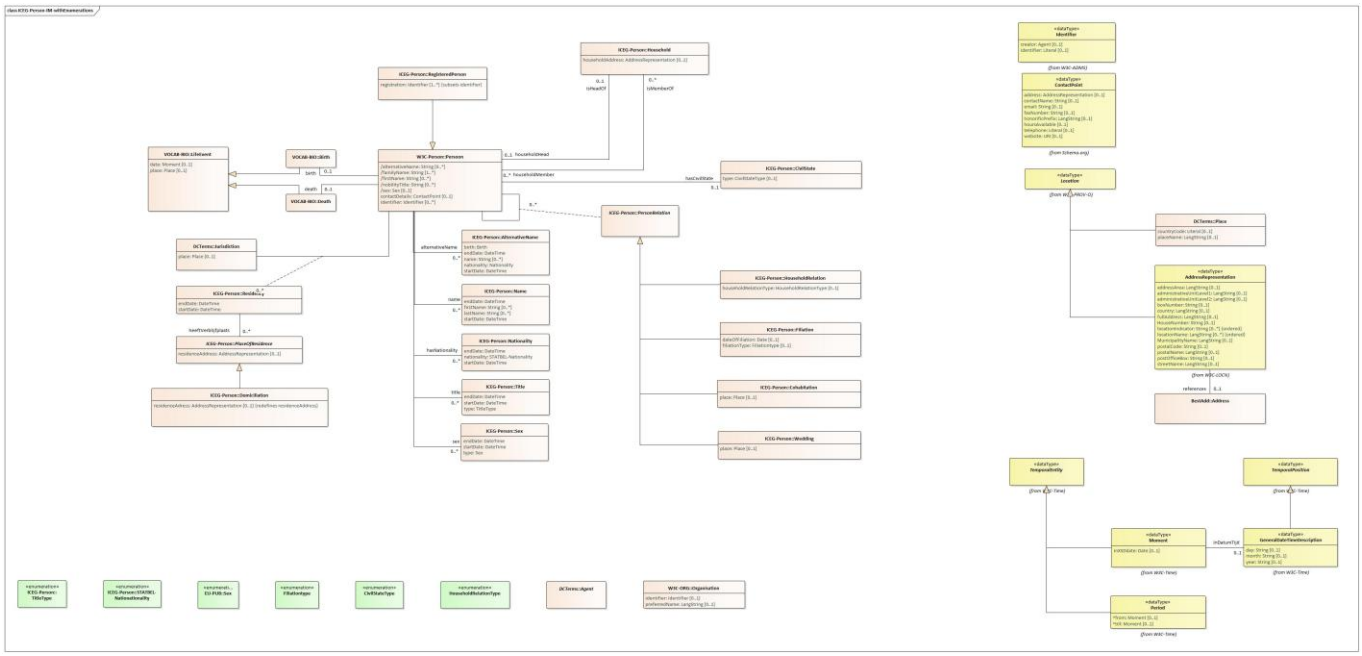

- ***Answer:*** *The discussion on language is* ***parked****. The language linked to an address should be taken up by* ***BeSt Address*** *rather than in this model; a dedicated session with legal advisors and BeSt representatives was suggested.*

DRAFT MODEL

On the basis of the three use cases, the draft model was extended with the concepts needed for residence and address. The main elements are the following:

- **Jurisdiction:** the state or authority whose place of residence or domiciliation belongs to (e.g. Belgium).
- **Residency:** per jurisdiction, a person has a residency which groups the places of residence. A residency with no place of residence can still indicate that the person was known in that jurisdiction.
- **Place of Residence:** the place where a person actually lives or stays, with a start date and an end date. A person can have several places of residence at the same time (0..*).
- **Domiciliation:** a subclass of Place of Residence representing the official (legal) residence. A person has at most one domiciliation per jurisdiction at a time.
- **Address representation:** a data type containing the address fields (street, house number, box number, postal code, municipality, country…), with an optional link to BeSt Address. The link is optional because a BeSt identifier is not available for foreign addresses.
- **Contact point:** the correspondence address is not a residence and is captured under the contact details of the person (ContactPoint) as an address representation.

Below is an overview of the draft model presented during the second thematic workshop.

DISCUSSION

The draft model was built up based on three use cases covering the agreed scope for this thematic workshop. The main concepts and the feedback/questions raised during this second thematic working group on Address and Residence are discussed in more detail below.

USE CASE 1 - Change of main household residence

Sofie lives with her two children at Rozenlaan 25, box A, in Ghent. She declares to the municipality that the family is moving to Bondgenotenlaan 10, in Leuven. Leuven registers the new residence, and all three household members get the same new residence on the same date. Afterwards the municipality notices the date was entered wrongly and corrects it. Later, Leuven renumbers the street. Sofie has not moved, but her address has changed.

The following concepts were presented:

- **Address:** a structured description of a place where a person can live or be reached (street, number, box/unit, postal code, municipality). For Belgian addresses it refers to the official address register.
- **(Main) Residence:** the place where a person usually lives and is registered. It has a start, an end, the registering authority and the address. A person has one legal domiciliation per jurisdiction at a time.
- **Jurisdiction:** the state or authority whose register or rules a domiciliation belongs to.
- **Declaration of change of main residence:** the formal act by which a person or household notifies the municipality of a move. It ends the previous legal domiciliation and starts the new one.
- **Household address:** the address shared by the members of a household.

Questions and remarks:

Question: Why is Residency split from Place of Residence, since every place of residence already has its own start and end date? Can there be zero places of residence, and can a person have several places of residence in the same period?

- ***Answer:*** *Residency is defined per jurisdiction. A person can have several places of residence in the same period (e.g. children of divorced parents, a student room next to the family home) and at most one domiciliation per jurisdiction at a time.*

Remark: The model contains a head of household. This is a concept of the past; is it still needed?

- ***Answer:*** *Relations between persons and the household composition will be discussed in Thematic Workshop 3 (Family Relations and Civil Status). In this use case "household" was only used to show the use case of the Household Address attribute.*

Remark: The declaration of a new address does not immediately result in a new domiciliation: the new domiciliation follows only after a check by the police. Knowing when a change was declared and when it became effective is very important; questions are regularly received about when a change was actually done, as the effective registration may follow weeks or months after the declaration.

- ***Answer:*** *A status and the associated dates will be added to the Domiciliation (or to the Place of Residence).*
- ***Action:*** *The core team will make a proposal. Multiple domiciliations with a different status (one not yet confirmed, one confirmed) may then coexist.*

Remark: A renumbering is not a move. In the model as presented, the renumbering creates a new domiciliation record with a new start date. A change of address, however, triggers a whole chain of processes (police check, energy contracts, etc.), while a renumbering should not. It must be clear whether the BeSt identifier of the address stays the same (new version) or changes in such a case; the practice seems to differ between the

Regions. According to BeSt, only corrections (i.e. a spelling error in a street name) keep the same identifier; a renumbering is a new value and therefore a new identifier.

- ***Answer:*** *The behaviour of the BeSt identifier (when does it stay the same and when does it change) must be clarified with BeSt Address. The history of addresses (renumbering, renaming, versioning) is the responsibility of BeSt Address and should not be modelled in this trajectory: the model refers to an address representation with an optional link to BeSt Address.*

Remark: To make clear that a person still lives in the same physical place, the concept of **building unit** (and parcel) could be considered. In case of a renumbering, the building unit remains the same; when a person moves to another apartment in the same building, the building unit changes. Related use cases also include mergers of municipalities, where the name of the municipality changes.

- ***Answer:*** *The building unit is acknowledged as an important concept. The participants are asked to send additional use cases on mergers of municipalities, renumbering and renaming, so that they can be assessed.*

USE CASE 2 - Temporary absence & foreign address

Lina lives in Mechelen, where she is registered. Her employer sends her to Nairobi for a mission. She tells the municipality she will be temporarily absent and gives her address in Nairobi. Her residence in Mechelen does not change. She also asks for her post to go to a PO box in Nairobi. Later she decides to stay in Kenya permanently. Her Belgian residence ends. She registers with the Belgian embassy, and her main residence is now abroad.

The following concepts were presented:

- **Temporary absence:** a period in which a person does not live at their main residence but keeps enough ties to return at any time. The main residence does not end. The place of stay is recorded when known.
- **Place of stay:** where a person actually is for a period, whether or not they are registered there. It is a factual location, not a registration.
- **Residence abroad:** the residence of a Belgian who has settled abroad.
- **Correspondence address:** the address where a person wants to receive mail. It is is held under ContactPoint.

In the timeline, Lina keeps her domiciliation in Mechelen (Belgian jurisdiction) while she has a place of residence in Nairobi (Kenyan jurisdiction). When she settles permanently, the domiciliation in Mechelen ends and a domiciliation (residence abroad) starts at the same Nairobi address. The PO box is captured as a ContactPoint address.

Questions and remarks:

Remark: Before registering with the embassy in Kenya, Lina may be struck off ("radiated") from the Belgian registers. Where is this information recorded? A status such as active or radiated is needed, and gaps can occur between the end of the Belgian domiciliation and the registration abroad. If the person announced a temporary absence, no radiation will take place; if the person simply leaves, there may be a period during which no Belgian authority actively follows the person.

- ***Answer:*** *The status to be added on the domiciliation can express that the domiciliation is radiated, under the Belgian jurisdiction which owns that information. This scenario needs to be worked out as a separate use case on a timeline.*
- ***Action****: KSZ is invited to provide its specific radiation use case(s).*

USE CASE 3 - Dual domiciliation & reference address

Marcell fled from a country in conflict. In Belgium he applies for asylum and is provisionally registered at the address of a reception centre. After a few months he is recognised as a refugee and registers at an address in Leuven. After verification of his new declared address, he now has a domiciliation in Belgium and, still on record, one in his country of origin.

The following concepts were presented:

- **Dual domiciliation:** a person who holds a domiciliation in two jurisdictions at the same time. Each jurisdiction has at most one at a time.
- **Provisional registration:** registration on declaration, before the address is checked.
- **Verification of residence:** a check that the person actually lives at the declared address.
- **Reference address:** an address where a person without a fixed home is registered, with the consent of the person or organisation at that address. Only for defined categories: lack of means, mobile home, detention, professional reasons, foreign mission, military service, victim.

Questions and remarks:

Remark: The reception centre in the use case is not a reference address in the legal sense. A reference address is an address where the person is registered and can be contacted, but where the person does not live. The **reason** for the reference address (lack of means, detention, mission, etc.) is needed, because some institutions take different actions depending on that reason (e.g. a person in prison versus a homeless person registered at a CPAS).

- ***Answer:*** *Where a person physically stays (e.g. a prison) is the place of residence; where the person is officially registered is the domiciliation. These are two separate records, which is why the cardinality is 0..*. The reason will be considered as an additional attribute, in line with the address type (see US1).*

Remark: An address in KSZ can exists for members of the diplomatic corps living in Belgium, who can choose whether or not to register with the municipality but whose address in Belgium must be known in certain situations; and persons living abroad (e.g. in Spain) who indicate a contact address in Belgium (e.g. at their daughter's) when coming for medical treatment.

- ***Answer:*** *The contact address in Belgium is captured as a contact point address, distinct from the place of residence address. The model allows multiple addresses so that this can be supported depending on the use case.*

Remark: The refugee is not a good example of dual domiciliation: a refugee will not claim or keep a domicile in his country of origin. Dual domiciliation is also a problem for several applications, because many processes are based on the domicile being one unique location. With this model, the domicile is unique within its jurisdiction.

- ***Answer:*** *Other participants argued that the model must technically allow more than one domiciliation, because the definition of a domicile can depend on the legal basis and closing the door now would be permanent; restrictions can be imposed at implementation. The model allows one domiciliation per jurisdiction and multiple places of residence, but the refugee use case will not be used as an example of dual domiciliation.*

Remark: The start date of the domiciliation in the country of origin is shown as "unknown". A block of address without a start date has no value and cannot be used. In practice, if the official start date is not known, the date of encoding (creation date) is used.

- ***Answer****: The start date on Address becomes mandatory**. A rule must be defined for the case where the official start date is not known to use the encoding date.*

NEXT STEPS

All input from the thematic working group has been consolidated in this report, for which any feedback is welcome. Feedback is captured via GitHub (https://github.com/belgif/thematic/issues). The third thematic workshop will take place on **Thursday 19 November 2026**, from 10:00 to 12:30. The topic is **Family Relations and Civil Status**. Registration is possible via this link.
